

# Consumer Confidence Report

The City of Chicago Heights  
2018 Annual Water Quality Report

David A. Gonzalez, Mayor  
Karen Zerante, Chief of Staff  
Danika Owens, Water Superintendent

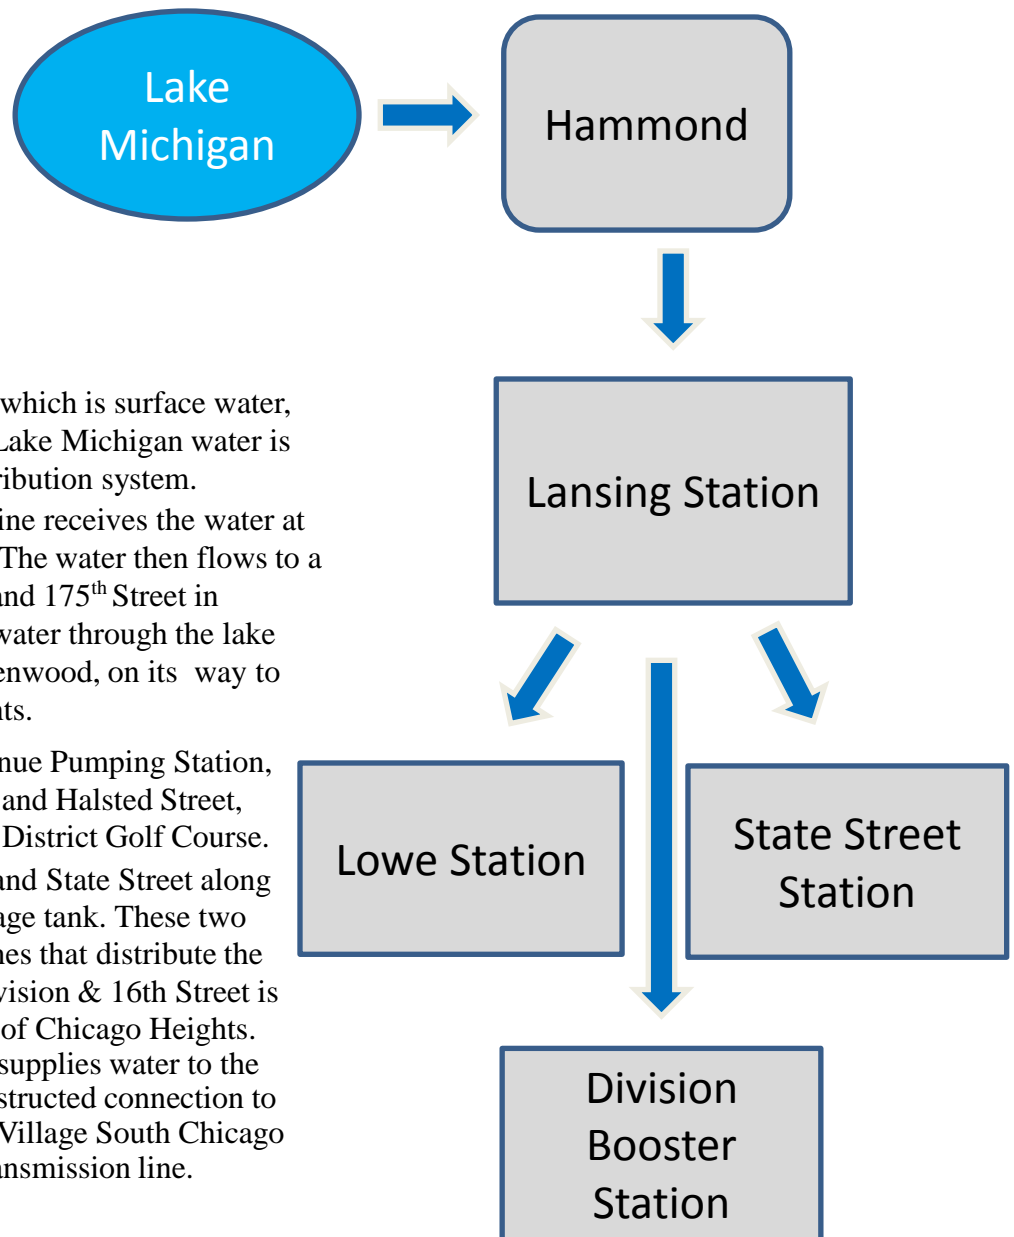

The City of Chicago Heights is pleased to present our 2018 Water Quality Report. This edition covers all testing completed from January 1, 2018 through December 31, 2018. This report provides you with information about the quality of your drinking water. Our water quality testing and monitoring assures you the highest quality of drinking water. We are dedicated to producing drinking water that meets all state and federal drinking water standards.

We want our valued customers to be informed about their water quality. For more information about this report, or for any questions relating to your drinking water, please call 708-756-5381.

## How We Get Our Water

Our source water is Lake Michigan, which is surface water, purchased from Hammond, Indiana. The Lake Michigan water is treated and pumped into Hammond's distribution system.

The City of Chicago Heights' lake line receives the water at 172<sup>nd</sup> and State Line Road in Hammond. The water then flows to a booster station located at Paxton Avenue and 175<sup>th</sup> Street in Lansing, Illinois. This station boosts the water through the lake line, providing water to Thornton and Glenwood, on its way to two distribution stations in Chicago Heights.

The largest of these is our Lowe Avenue Pumping Station, which is located east of Vollmer Road and Halsted Street, surrounded by the Chicago Heights Park District Golf Course.

The second station is located at 14<sup>th</sup> and State Street along with a one million-gallon elevated storage tank. These two stations are connected by large water lines that distribute the water evenly throughout the city. Our Division & 16th Street is utilized to further supply our customers of Chicago Heights.

The City of Chicago Heights also supplies water to the Village of Ford Heights through a reconstructed connection to the City's distribution system and to the Village South Chicago Heights through a southbound transmission line.

## Important Health Information

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the **USEPA's Safe Drinking Water Hotline (1-800-426-4791)**.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We are responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. You can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at <http://www.epa.gov/safewater/lead>.

# CHICAGO HEIGHTS WATER QUALITY REPORT

**Este informe contiene información muy importante. Tradúscalo ó hable con alguien que lo entienda bien.**

<u>Regulated Substances</u>								
Monitoring Data Collected by Chicago Heights Water Department								
<u>Contaminant (unit of measure)</u>	<u>Date Tested</u>	<u>Unit</u>	<u>Goal (MCLG)</u>	<u>Maximum Allowed (MCL)</u>	<u>Detected Level</u>	<u>Range of Values Tested</u>	<u>Violation</u>	<u>Likely Source of Contaminants</u>
Total Trihalomethanes (TTHM)	2018	ppb	No goal for total	80	18	11.2 – 23.6	N	By-product of drinking water disinfection.
Halo Acetic Acids (HAA5)	2018	ppb	No goal for total	60	5	3.8 – 6	N	By-product of drinking water disinfection.
Chlorine	2018	ppm	MRDLG = 4	MRDL = 4	0.1	0.1-0.2	N	Water additive used to control microbes.
<u>Lead and Copper</u>								
<u>Contaminant</u>	<u>Date Sampled</u>	<u>Unit</u>	<u>Goal (MCLG)</u>	<u>Action Level (AL)</u>	<u>90th Percentile</u>	<u># of Sites over AL</u>	<u>Violation</u>	<u>Likely Source of Contaminants</u>
Copper	2017	ppm	1.3	1.3	0.137	0	N	Erosion of natural deposits; Leaching from wood preservatives. Corrosion of household plumbing systems.
Lead	2017	ppb	0	15	6.59	0	N	Corrosion of household plumbing systems; Erosion of natural deposits.
<u>Monitoring Data Collected by Hammond Indiana</u>								
The following contaminants were detected in the Finished Water at the entry point to our distribution system. This information is provided by our Parent Supplier.								
<u>Microbiological Contaminants</u>	<u>Date Tested</u>	<u>Unit</u>	<u>Goal (MCLG)</u>	<u>Maximum Allowed (MCL)</u>	<u>Detected Level</u>	<u>Range of Values Tested</u>	<u>Violation</u>	<u>Likely Source of Contaminants</u>
Total Coliform	2018	% of Samples	0	1	1	N/A	N	Naturally present in environment
Turbidity	2018	NTU	n/a	TT	0.05-.014	n/a	N	Soil Runoff
Highest Single Measurement			1 NTU		0.14 NTU		N	
Lowest Monthly % Meeting Limit			0.3 NTU		100%		Soil Runoff	
<u>Inorganic Chemicals</u>	<u>Date Tested</u>	<u>Unit</u>	<u>MCLG</u>	<u>MCL</u>	<u>Detected Level</u>	<u>Range of Values Tested</u>	<u>Violation</u>	<u>Likely Source of Contaminants</u>
Fluoride	2018	ppm	4	4	1	0.2-1.8		Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Sodium	2018	ppb	n/a	n/a	8.8mg/L	n/a		n/a
Barium	2018	ppm	2	2	0.019	n/a		Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Nitrate (measured as Nitrogen)	2018	ppm	10	10	0.38	n/a		Runoff from fertilizer use; Leaching from septic tanks, sewage
<u>Disinfectant &amp; Disinfection By Products</u>	<u>Date Tested</u>	<u>Unit</u>	<u>MCLG</u>	<u>MCL</u>	<u>Detected Level</u>	<u>Range of Values Tested</u>	<u>Violation</u>	<u>Likely Source of Contaminants</u>
Disinfectant Residual	2018	n/a	n/a	n/a	n/a	1.6 - 2.2 mg/L		By- product of drinking water chlorination
Total Halo acetic Acids	2018	n/a	n/a	n/a	n/a	2.5– 4.2 mg/L		By- product of drinking water chlorination

## Table Definitions

**Maximum Contaminant Level Goal (MCLG):** The level of a contaminant in drinking water below, which there is no known expected risk to health. MCLGs allow for a margin of safety.

**Maximum Contaminant Level (MCL):** The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

**Level Found:** This column represents an average of sample result data collected during the CCR calendar year. In it may represent a single sample if only one sample was taken.

**Range of Detections:** This column represents a range of individual sample results; from lowest to highest that were during the CCR calendar year.

**Date of Sample:** If a date appears in this column, the Illinois EPA requires monitoring for this contaminant less than a year because the concentrations do not frequently change. If no date appears in the column, monitoring for this contaminant was not conducted during the Consumer Confidence Report calendar year.

**Action Level (AL):** The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

**Treatment Technique (TT):** A required process intended to reduce the level of a contaminant in drinking water.

**Unregulated Contaminants:** A maximum contaminant level (MCL) for this contaminant has not been established by either state or federal regulations, nor has mandatory health effects language. The purpose for monitoring this contaminant is to assist USEPA in determining the occurrence of unregulated contaminants in drinking water, and whether future regulation is warranted.

**ND:** Not detectable at testing limits.

**N/A:** Not applicable

**N/G:** No goal for the total.

**ppb (parts per billion):** One part substance per billion parts water or micrograms per liter.

**ppm (parts per million):** One part substance per million parts water or milligrams per liter.

**% pos/mo:** Percentage of positive samples per month.

**# pos/mo:** Number of positive samples per month.

# Educational Information

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it can dissolve naturally occurring minerals and radioactive materials, and pick up substances resulting from the presence of animals or human activity.

Possible contaminants consist of:

- such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, or wildlife.
- such as salts and metals, which can be naturally occurring or may result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- which may come from a variety of sources such as agriculture, urban storm water runoff and residential uses.
- including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and which may also come from gas stations, urban storm water runoff and septic systems.
- which can be naturally occurring or may be the result of oil and gas production and mining activities.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. IFDA regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. In order to insure that tap water is safe to drink, USEPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems.

**More information about contaminants and potential health effects can be obtained by calling: USEPA's Safe Drinking Water Hotline (1-800-426-4791)**

## WATER SAVING TIPS

### Only wash full loads of dishes in the dishwasher

- If washing dishes by hand, fill the sink with water instead of continually running the tap.
- The average American family washes approximately 110 loads of dishes per year.
- An older model dishwasher will use approximately 10 to 15 gallons of water per load.

### Make sure your faucets don't drip or leak. Find and fix any leaky faucets.

- Avoid running water to thaw frozen food.
- Turn off the faucet when lathering hands, shaving or brushing teeth.
- Faucet water use accounts for 15% to 18% of the overall water consumption.

### When doing laundry, always wash full loads.

- A standard washer will use approximately 40 to 45 gallons of water per load.
- A family of four using a standard clothes washer will generate more than 300 loads per year, consuming 12,000 gallons of water.
- Conventional washers typically use about 40 gallons per load; a resource-efficient washer may use as little as 15 gallons per load.
- Washing laundry is a significant use of water in the average home; accounting for 15% to 40% of the overall water consumption.

### A running toilet can waste hundreds of gallons of water per day.

- Make sure the water level is not too high, the fill valve is working properly, and the flapper is not leaking.
- Do not use the toilet as a trash can.
- Researchers have found that 20% to 35% of residential toilets leak to some degree.
- Toilet flushing is the single highest use of water in the average home, with the average person flushing 5 times per day.
- Large toilet leaks can be detected when the valve constantly emits a hissing or gurgling sound when the toilet is not in use.

Did you know?

Turn off the tap when washing your face, brushing your teeth or shaving

Shorten your showers by one to two minutes

Water your yard before 8 a.m. to reduce evaporation
